Project Fiche – 2009 IPA Horizontal Programme on Nuclear Safety and Radiation Protection

1. Basic information

1.1 CRIS Number: 2009/021-640
1.2 Title: Strengthening the system of dosimetry control for occupationally exposed workers and patients
1.3 ELARG Statistical code: 03.64 - Nuclear safety
1.4 Location: Bosnia and Herzegovina, as well as Kosovo under UNSCR 1244/99

Implementing arrangements:

1.5 Contracting Authority:
The European Community represented by the Commission of the European Communities for and on behalf of Bosnia and Herzegovina and Kosovo¹.

1.6 Implementing Agency:
Not applicable.

1.7 Beneficiaries:
Bosnia and Herzegovina and Kosovo; and in particular:
Ms Draženka Malićbegović
Ministry of Civil Affairs
Sector for Health
Trg BiH 1, 71000 Sarajevo
Bosnia and Herzegovina
Tel: 0038733492523
Fax: 0038733492621;
E-mail address: drazenka.malicbegovic@mcp.gov.ba

Other beneficiaries from Bosnia and Herzegovina:
State Regulatory Agency for Radiation and Nuclear Safety of Bosnia and Herzegovina
Ministry of Health of the Republic of Srpska, Ministry of Health of the Federation of Bosnia and Herzegovina.

Mr. Xhevat Plana
Institute of Occupational Medicine
15000-Obiliq
Kosovo
Phone: +381 38 561 695
Fax: +381 38 560 143
E-mail: info@imp-sha.com

The National Agency for Radiation Safety (being established)

¹ under UNSCR 1244/99
Ministry of Environment and Spatial Planning  
Street Nazim Gafurri, 103  
10000-Prishtina  
Kosovo  
Phone: +381 38 200 32 004  
E-mail: belkize.ajdini@ks-go.net

**Financing:**

1.8 Overall cost (VAT excluded)^2^: EUR 786 000  
1.9 EC contribution: EUR 660 000

1.10 Final date for contracting: 2 years following the date of conclusion of the financing agreements  
1.11 Final date for execution of contracts: 2 years following the end date for contracting  
1.12 Final date for disbursements: 1 year following the end date for execution of contracts

2. Overall Objective

2.1 Overall Objective:  
To improve health protection of individuals (members of the public, workers, and patients) against the dangers of ionising radiation.

2.2 Project purpose:  
To improve the dosimetry control of exposed workers and patients to ionising radiation in medical and other establishments in Bosnia and Herzegovina and in Kosovo.

2.3 Link with AP/NPAA/EP/SAA

*For Bosnia and Herzegovina*

The Stabilisation and Association Agreement between Bosnia and Herzegovina, and the European Communities and the Member States, stipulates under Article 107 that “Cooperation shall focus on priority areas related to the Community *acquis* in the field of energy, including, as appropriate, nuclear safety aspects…”

*For Kosovo*

The 2008/213/EC: Council Decision of 18 February 2008 on the principles, priorities and conditions contained in the European Partnership with Serbia including Kosovo as defined by United Nations Security Council Resolution 1244 of 10 June 1999 and repealing Decision 2006/56/EC, highlights the need to accede to the relevant international conventions relating to nuclear safety and to set up the appropriate regulatory body.

---

^2^ The total cost of the project should be net of VAT and/or other taxes. Should this not be the case, the amount of VAT and the reasons why it should be considered eligible should be clearly indicated.
In addition the Kosovo 2008 Progress report states that there was so far no progress as regards nuclear safety/radiation protection. It considers that in the area of nuclear safety/radiation protection, basic rules need to be implemented and an appropriate and operational regulatory body needs to be set up. Important radiological issues in Kosovo include the management of sealed radioactive sources, environmental monitoring and radiation protection in the context of medical and industrial applications.

2.4 Link with MIPD

The IPA Multi-beneficiary Multi-annual indicative Planning Document (MIPD) 2009-2011, section 2.3.3.11 - Nuclear Safety and Radiation Protection, mentions that “all IPA eligible beneficiaries are facing radiological issues that are connected with the use of radionuclides for industrial and medical applications”. It concludes that "radiological issues in the IPA beneficiaries should be addressed with the view to eventually transposing the acquis in the nuclear domain, including the international conventions to which the European Community is a party. This transposition would require a number of legislative and regulatory actions and would affect current management practices of radionuclides and radioactive materials”.

2.5 Link with National/Sectoral Investment Plan

Mid-term Development Strategy of Bosnia and Herzegovina (PRSP) 2004-2007 includes – among the others – Sector Priorities of Health care, Environment and Information and Communication Technology, precisely for the first two instances:

“V.3. SECTOR PRIORITIES – HEALTH CARE
1. Reform goals in the sector:
1.1. ensure a universally accessible, socially acceptable health care system based on the principles of solidarity and equity, ensuring access for various social groups (especially the poor) to a guaranteed basic package of health care rights and services,
1.2. ensure an efficient and transparent health care system focused on the promotion of health and the prevention of diseases,
1.3. ensure a quality-oriented system with constant improvement of the quality of health care and clinical supervision,
1.4. ensure a system focused on health care needs, actively involving the interests and opinions of both patients and medical workers. ”

“V.7. SECTORAL PRIORITIES – ENVIRONMENT
1. Goals:
1.1. Implement Environment Protection Action Plan BiH (NEAP)”

3. Description of project

3.1 Background and justification:

Bosnia and Herzegovina

Until recently, legislation on monitoring of occupationally exposed workers to ionising radiation was covered by the regulations on limits of exposure laid down by the two
political entities of Bosnia and Herzegovina: the Federation of Bosnia and Herzegovina (FBH), and the Srpska Republic of Bosnia and Herzegovina (SR), namely:

- Regulations for Dose Limits (Official Gazette of FB&H No.8/04) and;
- Regulation on Dose Limits (Official Gazette of RS, No. 73/03).

In November 2007 a new national Law on Radiation Protection and Nuclear Safety (Official Gazette of Bosnia and Herzegovina, No. 88/07) was promulgated. Newly adopted regulations must be in line with the International Basic Safety Standards for Protection against Ionising Radiation, and with the Euratom Council Directives on radiation protection.

In the FBH, the Radiation Protection Centre (RPC) of the Institute of Public Health is an institution that provides personal dosimetry for workers exposed to ionising radiation. RPC provides assessment for external dose to nearly 1300 occupationally exposed workers from the FBH and to a lesser extent from the RS (~50) and from the Brčko District (~4). For approximately 500 workers, personal dosimetry service is currently provided outside of the country. The lack of appropriate dosimetry equipment cannot enable a comprehensive follow up of all workers potentially exposed to ionising radiation, which is estimated at present to 1800 in total for the whole country.

RPC carries out personal dosimetry monitoring using the 4500 Manual TLD Reader which provides readout of Harshaw TLD dosimeters. The reader has been used since 1998 and, at present, is not sufficient to cover the growing demands for personnel dosimetry monitoring. Apart from individuals that are not covered by dosimetry service, there is a need for additional dosimeters for professionals in interventional radiology and cardiology.

Existing procedures do not enable a full assessment of the occupational exposure of extremities of the body (e.g. hands, forearms, feet and ankles). Dosimetry of hands is recommended by the International Atomic Energy Agency (IAEA) for all nuclear medicine departments. Measurement of the ambient gamma dose-rate of controlled areas is not performed, again for lack of equipment.

The provisions of the Council Directive 96/29 Euratom and in particular Articles 23, 24 and 25 require the assessment and implementation of arrangements for the radiological protection of exposed workers (in this case, the personnel of controlled areas in medical establishments), and the monitoring of the workplace as well as individual monitoring for exposed workers.

According to the provisions of Article 4 of the Council Directive 97/43 Euratom, "Member States shall promote the establishment and the use of diagnostic reference levels for radio diagnostic examinations, and the availability of guidance for this purpose having regard to European diagnostic reference levels where available".

Compliance with the provisions of both Council Directives can only be established if institutions from Bosnia and Herzegovina have proper equipment and educated personnel.
This project is intended to make the first steps for implementing these Council Directives via:

- Technical assistance to drafting diagnostic reference levels and protocols for patient dosimetry;
- Supply of appropriate dosimetry equipment;
- The setting up of a national database on occupational exposure;
- The organisation of a training course for the personnel of medical establishments

Diagnostic reference levels will be established for the most common diagnostic procedures such as: head, chest, LS spine, pelvis, intravenous urography, barium meal and barium enema. After dose assessment there will be a background for reduction of patient doses through implementing various procedures. Medical staff (radiologists and general practitioners) will be informed on doses and risks of radiological procedures. Patients will be able to know doses and risks associated with procedure before and after examination. This will be very helpful for accidently exposed pregnant patients.

**Kosovo**

In Kosovo, the Institute for Occupational Medicine (IOM) comprises a service dealing with radiation protection. This service is providing personal dosimetry for workers exposed to ionising radiation. IOM provides assessment for external dose to nearly 650 occupationally exposed workers. Actually more workers in Kosovo are exposed to ionising radiation since a number of private clinics using various X-ray machines are not yet registered.

IOM carries out personal dosimetry monitoring using an old "Toledo" Model 654 TLD reader, which provides readout of TLD dosimeters. The reader has been used since the eighties and at present does not work properly. The reader is not compatible with other systems, has a low sensitivity and is no more reliable. It cannot comply with the growing demands for personnel dosimetry monitoring.

Existing procedures in Kosovo do not enable a full assessment of the occupational exposure. Measurement of the ambient gamma dose-rate of controlled areas is not performed, again for lack of equipment.

The provisions of the Council Directive 96/29 Euratom and in particular Articles 23, 24 and 25 require the assessment and implementation of arrangements for the radiological protection of exposed workers (in this case, the personnel of controlled areas in medical establishments), and the monitoring of the work place as well as individual monitoring for exposed workers.

According to the provisions of Article 4 of the Council Directive 97/43 Euratom, "Member States shall promote the establishment and the use of diagnostic reference levels for radio diagnostic examinations, and the availability of guidance for this purpose having regard to European diagnostic reference levels where available".

Compliance with the provisions of both Council Directives can only be established if institutions from Kosovo have proper equipment and educated personnel.
This project is intended to make the first steps for implementing these Council Directives via:

- Technical assistance to drafting diagnostic reference levels and protocols for patient dosimetry;
- Supply of appropriate dosimetry equipment;
- The setting up of a national database on occupational exposure;
- The organisation of training courses for the personnel of medical establishments

The choice of Bosnia and Herzegovina and Kosovo as Beneficiaries of the project simply results from the fact that both Beneficiaries are placing dosimetry control as part of their priorities for 2009.

3.2 Assessment of project impact, catalytic effect, sustainability and cross border impact

In terms of impact, the project should contribute to significantly decrease the individual and collective doses of the populations of Bosnia and Herzegovina, and Kosovo. It has a catalytic effect in the sense that as a result of the reliable assessment of the doses to workers and patients, appropriate measures should be taken to improve radiation protection in a number of industrial and medical establishments. It is sustainable since the persons to be trained will become afterwards themselves trainers. In addition, the sustainability is guaranteed by the necessity for these Beneficiaries to comply with the Euratom Council Directives on radiation protection. There is no direct cross border impact.

3.3 Results and measurable indicators:

Results in relation with activity 1:

1. External dose rates in a selection working places measured;
2. Diagnostic Reference Levels for radiodiagnostic examinations drafted;
3. Procedures for evaluation of patient doses drafted;
4. Database on doses received by patients and workers in medical establishments, operational;
5. Educational programme for personnel in charge of patient dosimetry in diagnostic radiology set up, and attendance certificates for trainees granted;
6. Technical specifications for the equipment drafted;
7. Equipment installed and in operation.

Main indicator in relation with activity 1:

Dosimetry control of 1800 and 700 persons in Bosnia and Herzegovina and Kosovo respectively

Results in relation with activity 2

The delivery of pieces of equipment in full compliance with the identification of the needs and the determination of technical specifications performed under activity 1.
Main Indicator in relation with activity 2:

The Radiation Protection Centre (RPC) of the Institute of Public Health of the Federation of Bosnia and Herzegovina, and the Institute of Occupational Medicine in Kosovo are fully equipped to perform dosimetry control of their respective population.

3.4 Activities:

Activity 1: One service contract concerning technical assistance to be provided to the beneficiary institutions.

This activity will consist of assisting local experts in order to:

1.1. Assess doses of occupationally exposed workers in medical establishments (Bosnia and Herzegovina and Kosovo) including whole body and extremities dosimetry (Bosnia and Herzegovina);
1.2. Determine the time-temperature profile characteristics of automatic thermo luminescent dosimeters reader (Bosnia and Herzegovina);
1.3. Assess doses to patients (Bosnia and Herzegovina, Kosovo);
1.4. Establish a computerised database of professionally exposed workers (Bosnia and Herzegovina, Kosovo);
1.5. Draft the national reference levels for different categories of professionally exposed workers (nuclear medicine, radiology departments, etc) in Bosnia and Herzegovina;
1.6. Introduce patient dosimetry protocols in major hospitals of Bosnia and Herzegovina and Kosovo;
1.7. Establish Diagnostic Reference Levels (Bosnia and Herzegovina, Kosovo);
1.8. Build a national database of patient doses (Bosnia and Herzegovina, Kosovo);
1.9. Educate personnel in the field of patient dosimetry in diagnostic radiology (Bosnia and Herzegovina, Kosovo);
1.10. Identify the technical specifications of the equipment required to strengthen the system of dosimetry control for occupationally exposed workers and patients in Bosnia and Herzegovina and Kosovo

Activity 2: One supply contract for the delivery of equipment. A priori the following pieces of equipment would be needed:

2.1. One automatic thermo luminescent reader with internal irradiator and N2 generator and 2 desktop computers;
2.2. One manual thermo luminescent reader with internal irradiator and N2 generator and 2 desktop computers;
2.3. Thermo luminescent dosimeters for measuring whole body 2300 pieces, extremities 100 pieces and working place doses 100 pieces;
2.4. Dose-area product meters (at least 24) used for direct patient dosimetry in radiographic, fluoroscopic and interventional procedures;
2.5. Advanced dosimetry equipment with multi-purpose detectors (at least 8);
2.6. Hardware and software for setting up a national database of patient doses.
However this list may be extended according to the results of activity No 1.

3.5 Conditionality and sequencing:

The implementation of this project requires a fully operational regulatory body in charge of radiological issues in Bosnia and Herzegovina and the establishment of a new one in Kosovo since part of the project will consist of drafting regulations on medical exposure. It is worth noting that by law a national nuclear regulatory agency exists in Bosnia and Herzegovina. Its full operation is expected to start by the end of 2009 once it is staffed. In Kosovo a law establishing a nuclear regulatory body should be promulgated by the end of 2009. This means that the Kosovar regulatory body could become fully operational by mid-2010, hence at the time of the launching of the tendering procedure.

Delivery of equipment for dosimetry monitoring must comply with the requirements of the regulatory body.

The supply contract should be launched six months after service contract.

3.6 Linked activities:

The project is linked to the IAEA project BOH 6011 "Strengthening Medical Physics Capacity in Diagnostic Radiology (Phase II)". This project is dealing with quality control and dosimetry in diagnostic radiology, as well as with education of medical physicists.

3.7 Lessons learned

Since the implementation of the IPA horizontal programme on nuclear safety and radiation protection started only recently, there is no feed-back that could be used to implement this project. The experience of the IAEA in supporting nuclear projects in Bosnia and Herzegovina did not reveal any major difficulty during their implementation. However it is considered that the quality and the sustainability of the IAEA support could be further improved if a fully operational regulatory body would be in place.

6. Cross cutting issues

6.1 Equal Opportunity

The project will benefit both women and men through improvements in environmental protection and safety.

The issue of access is mainstreamed into the project and the design at the territorial level allows for a more targeted equal opportunity framework for addressing different medical and other establishments, as well as patients in general, thus giving equal opportunity to everybody to get adequate information before and after exposure.
On all activities, both men and women will have equal opportunities to compete for contracts and to work on any related activities.

6.2 Environment

There are substantial environmental gains to the Beneficiaries by accomplishment of this project since an improvement of the dosimetry control of exposed workers and patients to ionising radiation in medical and other establishments should alert on doses and risks associated with radiological procedures and thereby reduce the risk of environmental contamination in general.

6.3 Minorities

On all activities, minorities will have equal opportunities to compete for contracts and to work on any related activities.

ANNEX III: Description of Institutional Framework

**Bosnia and Herzegovina**

The new Law on Radiation Protection and Nuclear Safety in Bosnia and Herzegovina plans the establishment of a "state regulatory agency for radiation protection and nuclear safety with appropriate set of functions and responsibilities, and resources required for the establishment of regulatory control". According to article 26 of this Law, "within six months after this Act enters into force, the regulatory agency shall issue the regulations on radiation safety and nuclear safety, radioactive waste management, and on safe transportation of radioactive substances". This scope of the Law should cover both political entities, i.e. the Federation of Bosnia and Herzegovina and the Republic of Srpska of Bosnia and Herzegovina. This agency should therefore be fully operational when the project starts, i.e. during the 3rd Q of 2010. Under Article 2, it is stated that the purpose of the Law is to: “establish and maintain a regulatory programme for ionising radiation sources, and thereby ensure compatibility with international standards on safety of radiation sources and for protection against ionising radiation".
Kosovo

According to provisions of the draft Law on protection against non-ionised, ionised radiation and nuclear security, management of radionuclides should be regulated by the Ministry of Environment and Spatial Planning. In principle this Law is expected to be promulgated in 2009.

ANNEX IV: Reference to laws, regulations and strategic documents

Bosnia and Herzegovina

Law on Radiation Protection and Nuclear Safety in Bosnia and Herzegovina

Kosovo

Since the early 90’s there has been no legal system in place concerning nuclear safety and radiation protection in Kosovo. Some regulations exist but are limited to application of ionising radiation in medical establishments (Administrative Instruction 03/2007 on application of ionised and non-ionised radiation in health).

ANNEX V: Details per EC funded contract

Contract 1: A service contract for an amount of EUR 250 000 will be concluded following a tender that will be launched in Q1 2010. The Contractor is expected to fulfil all the sub-activities listed in section 3.4 for activity 1 with the support of relevant organizations established in Bosnia and Herzegovina and Kosovo.

Contract 2: A supply contract for an amount of EUR 410 000 will be concluded following a tender that will be launched in Q1 2011. Co-financing from the national budget of Bosnia and Herzegovina (EUR 96 000) and Kosovo (EUR 30 000) should be made according to the IPA rules.

Activities 1 and 2 of the project will be tendered, awarded and implemented in accordance with the PRAG.
